

Rotary Table

LER Series

Size: 10, 30, 50

Battery-less Absolute (Step Motor 24 VDC)

Incremental (Step Motor 24 VDC)

Low profile

Basic type [mm]

Model	H
LER10	42
LER30	53
LER50	68

High-precision type [mm]

Model	H
LERH10	49
LERH30	62
LERH50	78

Continuous rotation specification

Rotation angle: 360°

p. 793

Shock-less/High speed actuation

Max. speed: 420°/s (7.33 rad/s)

Max. acceleration/deceleration: 3000°/s² (52.36 rad/s²)

Positioning repeatability: ±0.03° (High-precision type)

Repeatability at the end: ±0.01° (Pushing control/With external stopper)

Rotation angle

360°, 320° (310°), 180°, 90°

The value indicated in brackets shows the value for the LER10.

Can set speed, acceleration/deceleration, and position (Max. 64 points)

Energy-saving product

Automatic 40% power reduction after the table has stopped.

Size	Rotating torque [N·m]		Max. speed [°/s]		Page
	Basic	High torque	Basic	High torque	
10	0.22	0.32			p. 774
30	0.8	1.2	420	280	
50	6.6	10			

Battery-less Absolute (Step Motor 24 VDC)

Incremental (Step Motor 24 VDC)

Controllers/Drivers

p. 994

Step data input type

JXC51/61 Series

- 64 positioning points
- Input using controller setting kit or teaching box

EtherCAT/EtherNet/IP™/PROFINET/DeviceNet®/IO-Link/CC-Link direct input type

JXCE□/91/P1/D1/L□/M1 Series

Programless type^{*1}

LECP1 Series

- 14 positioning points
- Control panel setting

Pulse input type^{*1}

LECPA Series

- * Not applicable to the continuous rotation specification

*1 Excludes the battery-less absolute

Battery-less Absolute (Step Motor 24 VDC)

Restart from the last stop position is possible after recovery of the power supply.

Easy operation restart after recovery of the power supply

The position information is held by the encoder even when the power supply is turned off. A return to origin operation is not necessary when the power supply is recovered.

Does not require the use of batteries. Reduced maintenance

Batteries are not used to store the position information. Therefore, there is no need to store spare batteries or replace dead batteries.

Basic and high-precision types are available.

Basic type/LER

Rolling bearing

High-precision type/ LERH

High-precision bearing

The movement in the table's radial thrust direction is reduced.

Rotation angle

360°, 320°(310°), 180°, 90°
The value indicated in brackets shows the value for the LER10.

High torque

Output is **30** times with special worm gear. Special worm gear with reduced backlash is used.

Maximum rotation torque can be selected.

Belt deceleration ratio can be selected. [N·m]

Model	Basic	High torque
LER10	0.22	0.32
LER30	0.8	1.2
LER50	6.6	10.0

Step motor (Servo/24 VDC)

Space-saving

Manual override screw (Both sides)

Possible to rotate the table with power OFF by manual override.

Easy Mounting of Workpieces

- Tolerance between table's inside and outside diameter: H8/h8
- Dowel pin hole
- Hollow shaft axis
Accommodates wiring and piping of workpieces.

Gripper
LEH Series

For alignment of rotation center and workpiece

Dowel pin hole

Positioning of rotating direction

Hollow shaft axis

Size	10	30	50
Hollow shaft axis	ø8	ø17	ø20

Easy Mounting of the Main Body

Mounting Variations

■ Through-hole mounting

■ Body tapped mounting

Continuous Rotation Specification

Rotation angle: 360°
Return to origin with proximity sensor

With External Stopper/Rotation Angle: 90°/180° Specification

Repeatability at the end: $\pm 0.01^\circ$

Application Examples

For rotation transfer after gripping in combination with a gripper

For vertical transfer: No change in speed due to load fluctuation

For continuous operation of multiple processes with 360° continuous rotation

Rotary Table
LER Series

Model Selection

LER□E Series ▶ p. 779

Selection Procedure

Operating conditions

Electric rotary table: LER50EJ
 Mounting position: Horizontal
 Load type: Inertial load T_a
 Configuration of load: 150 mm x 80 mm
 (Rectangular plate)
 Rotation angle θ : 180°

Angular acceleration/
 angular deceleration $\dot{\omega}$: 1000°/s²
 Angular speed ω : 420°/s
 Load mass m : 6.0 kg
 Distance between shaft and center
 of gravity H : 40 mm

Step 1 Moment of inertia—Angular acceleration/deceleration

① Calculation of moment of inertia

Formula

$$I = m \times (a^2 + b^2)/12 + m \times H^2$$

② **Moment of inertia—Check the angular acceleration/deceleration**
 Select a model based on the moment of inertia and angular acceleration and deceleration while referencing the (Moment of Inertia—Angular Acceleration/Deceleration graph).

Selection example

$$I = 6.0 \times (0.15^2 + 0.08^2)/12 + 6.0 \times 0.04^2 = 0.0241 \text{ kg}\cdot\text{m}^2$$

LER50

Step 2 Necessary torque

① Load type

- Static load: T_s
- Resistance load: T_f
- Inertial load: T_a

Formula

Effective torque $\geq T_s$
 Effective torque $\geq T_f \times 1.5$
 Effective torque $\geq T_a \times 1.5$

② Check the effective torque

Confirm whether it is possible to control the speed based on the effective torque corresponding with the angular speed while referencing the (Effective Torque—Angular Speed graph).

Selection example

Inertial load: T_a
 $T_a \times 1.5 = I \times \dot{\omega} \times 2 \pi / 360 \times 1.5$
 $= 0.0241 \times 1000 \times 0.0175 \times 1.5$
 $= 0.63 \text{ N}\cdot\text{m}$

LER50

Step 3 Allowable load

① Check the allowable load

- Radial load
- Thrust load
- Moment

Formula

Allowable thrust load $\geq m \times 9.8$
 Allowable moment $\geq m \times 9.8 \times H$

Selection example

- Thrust load
 $6.0 \times 9.8 = 58.8 \text{ N} < \text{Allowable load OK}$
- Allowable moment
 $6.0 \times 9.8 \times 0.04 = 2.352 \text{ N}\cdot\text{m} < \text{Allowable moment OK}$

Step 4 Rotation time

① Calculation of cycle time (rotation time)

θ : Rotation angle [°]
 ω : Angular speed [°/s]
 $\dot{\omega}1$: Angular acceleration [°/s²]
 $\dot{\omega}2$: Angular deceleration [°/s²]
 T1: Acceleration time [s]... Time until reaching the set speed
 T2: Constant speed time [s]... Time while the actuator is operating at a constant speed
 T3: Deceleration time [s]... Time from the beginning of the constant speed operation to stop
 T4: Settling time [s]... Time until positioning is completed

Formula

Angular acceleration time $T1 = \omega / \dot{\omega}1$
 Angular deceleration time $T3 = \omega / \dot{\omega}2$
 Constant speed time $T2 = \{\theta - 0.5 \times \omega \times (T1 + T3)\} / \omega$
 Settling time $T4 = 0.2 \text{ [s]}$
 Cycle time $T = T1 + T2 + T3 + T4$

Selection example

- Angular acceleration time $T1 = 420/1000 = 0.42 \text{ s}$
- Angular deceleration time $T3 = 420/1000 = 0.42 \text{ s}$
- Constant speed time
 $T2 = \{180 - 0.5 \times 420 \times (0.42 + 0.42)\} / 420 = 0.009 \text{ s}$
- Cycle time $T = T1 + T2 + T3 + T4 = 0.42 + 0.009 + 0.42 + 0.2 = 1.049 \text{ [s]}$

Formulas for Moment of Inertia (Calculation of moment of inertia I)

I: Moment of inertia [kg·m²] m: Load mass [kg]

1. Thin bar

Position of rotation shaft:
Perpendicular to a bar through one end

2. Thin bar

Position of rotation shaft:
Passes through the center of gravity of the bar.

3. Thin rectangular plate (cuboid)

Position of rotation shaft: Passes through the center of gravity of a plate.

4. Thin rectangular plate (cuboid)

Position of rotation shaft: Perpendicular to the plate and passes through one end. (The same applies to thicker cuboids.)

5. Thin rectangular plate (cuboid)

Position of the rotation shaft: Passes through the center of gravity of the plate and perpendicular to the plate. (The same applies to thicker cuboids.)

6. Cylindrical shape (including a thin disk)

Position of rotation shaft: Center axis

7. Sphere

Position of rotation shaft: Diameter

8. Thin disk (mounted vertically)

Position of rotation shaft: Diameter

9. When a load is mounted on the end of the lever

10. Gear transmission

1. Find the moment of inertia I_B for the rotation of shaft (B).
2. Then, replace the moment of inertia I_B around the shaft (A) by I_A ,

$$I_A = \left(\frac{a}{b}\right)^2 \cdot I_B$$

Load Type

Load type		
Static load: T_s	Resistance load: T_f	Inertial load: T_a
Only pressing force is necessary. (e.g. for clamping)	Gravity or friction force is applied to rotating direction.	Rotate the load with inertia.
	Gravity is applied.	Center of rotation and center of gravity of the load are concentric.
$T_s = F \cdot L$ T_s : Static load [N·m] F : Clamping force [N] L : Distance from the rotation center to the clamping position [m]	Friction force is applied.	Rotation shaft is vertical (up and down).
	Gravity is applied to rotating direction. $T_f = m \cdot g \cdot L$ Friction force is applied to rotating direction. $T_f = \mu \cdot m \cdot g \cdot L$ T_f : Resistance load [N·m] m : Load mass [kg] g : Gravitational acceleration 9.8 [m/s ²] L : Distance from the rotation center to the point of application of the gravity or friction force [m] μ : Friction coefficient	$T_a = I \cdot \dot{\omega} \cdot 2 \pi / 360$ $(T_a = I \cdot \dot{\omega} \cdot 0.0175)$ T_a : Inertial load [N·m] I : Moment of inertia [kg·m ²] $\dot{\omega}$: Angular acceleration/deceleration [°/s ²] ω : Angular speed [°/s]
Necessary torque: $T = T_s$	Necessary torque: $T = T_f \times 1.5^{*1}$	Necessary torque: $T = T_a \times 1.5^{*1}$
<ul style="list-style-type: none"> • Resistance load: Gravity or friction force is applied to rotating direction. Ex. 1) Rotation shaft is horizontal (lateral), and the rotation center and the center of gravity of the load are not concentric. Ex. 2) Load moves by sliding on the floor. * The total of resistance load and inertial load is the necessary torque. $T = (T_f + T_a) \times 1.5$ • Not resistance load: Neither gravity or friction force is applied to rotating direction. Ex. 1) Rotation shaft is vertical (up and down). Ex. 2) Rotation shaft is horizontal (lateral), and rotation center and the center of gravity of the load are concentric. * Necessary torque is inertial load only. $T = T_a \times 1.5$ 		

*1 To adjust the speed, margin is necessary for T_f and T_a .

Model Selection

LER Series ▶ p. 785 Continuous Rotation Specification LER-1 Series ▶ p. 793

Selection Procedure

Operating conditions

Electric rotary table: LER30J
 Mounting position: Horizontal
 Load type: Inertial load T_a
 Configuration of load: 150 mm x 80 mm
 (Rectangular plate)
 Rotation angle θ : 180°

Angular acceleration/
 angular deceleration $\dot{\omega}$: 1000°/s²
 Angular speed ω : 420°/s
 Load mass [m]: 2.0 kg
 Distance between shaft and center
 of gravity H: 40 mm

Step 1 Moment of inertia—Angular acceleration/deceleration

① Calculation of moment of inertia

Formula

$$I = m \times (a^2 + b^2)/12 + m \times H^2$$

② **Moment of inertia—Check the angular acceleration/deceleration**
 Select a model based on the moment of inertia and angular acceleration and deceleration while referencing the (Moment of Inertia—Angular Acceleration/Deceleration graph).

Selection example

$$I = 2.0 \times (0.15^2 + 0.08^2)/12 + 2.0 \times 0.04^2 = 0.00802 \text{ kg}\cdot\text{m}^2$$

LER30

Step 2 Necessary torque

① Load type

- Static load: T_s
- Resistance load: T_f
- Inertial load: T_a

Formula

Effective torque $\geq T_s$
 Effective torque $\geq T_f \times 1.5$
 Effective torque $\geq T_a \times 1.5$

② Check the effective torque

Confirm whether it is possible to control the speed based on the effective torque corresponding with the angular speed while referencing the (Effective Torque—Angular Speed graph).

Selection example

Inertial load: T_a
 $T_a \times 1.5 = I \times \dot{\omega} \times 2 \pi / 360 \times 1.5$
 $= 0.00802 \times 1000 \times 0.0175 \times 1.5$
 $= 0.21 \text{ N}\cdot\text{m}$

LER30

Step 3 Allowable load

① Check the allowable load

- Radial load
- Thrust load
- Moment

Formula

Allowable thrust load $\geq m \times 9.8$
 Allowable moment $\geq m \times 9.8 \times H$

Selection example

- Thrust load
 $2.0 \times 9.8 = 19.6 \text{ N} < \text{Allowable load OK}$
- Allowable moment
 $2.0 \times 9.8 \times 0.04 = 0.784 \text{ N}\cdot\text{m} < \text{Allowable moment OK}$

Step 4 Rotation time

① Calculation of cycle time (rotation time)

θ : Rotation angle [°]
 ω : Angular speed [°/s]
 $\dot{\omega}1$: Angular acceleration [°/s²]
 $\dot{\omega}2$: Angular deceleration [°/s²]
 T1: Acceleration time [s]... Time until reaching the set speed
 T2: Constant speed time [s]... Time while the actuator is operating at a constant speed
 T3: Deceleration time [s]... Time from the beginning of the constant speed operation to stop
 T4: Settling time [s]... Time until positioning is completed

Formula

Angular acceleration time $T1 = \omega / \dot{\omega}1$
 Angular deceleration time $T3 = \omega / \dot{\omega}2$
 Constant speed time $T2 = \{\theta - 0.5 \times \omega \times (T1 + T3)\} / \omega$
 Settling time $T4 = 0.2 \text{ [s]}$
 Cycle time $T = T1 + T2 + T3 + T4$

Selection example

- Angular acceleration time $T1 = 420/1000 = 0.42 \text{ s}$
- Angular deceleration time $T3 = 420/1000 = 0.42 \text{ s}$
- Constant speed time
 $T2 = \{180 - 0.5 \times 420 \times (0.42 + 0.42)\} / 420 = 0.009 \text{ s}$
- Cycle time $T = T1 + T2 + T3 + T4 = 0.42 + 0.009 + 0.42 + 0.2 = 1.049 \text{ [s]}$

Formulas for Moment of Inertia (Calculation of moment of inertia I)

I: Moment of inertia [kg·m²] m: Load mass [kg]

1. Thin bar

Position of rotation shaft:
Perpendicular to a bar through one end

2. Thin bar

Position of rotation shaft:
Passes through the center of gravity of the bar.

3. Thin rectangular plate (cuboid)

Position of rotation shaft: Passes through the center of gravity of a plate.

4. Thin rectangular plate (cuboid)

Position of rotation shaft: Perpendicular to the plate and passes through one end. (The same applies to thicker cuboids.)

5. Thin rectangular plate (cuboid)

Position of the rotation shaft: Passes through the center of gravity of the plate and perpendicular to the plate. (The same applies to thicker cuboids.)

6. Cylindrical shape (including a thin disk)

Position of rotation shaft:
Center axis

7. Sphere

Position of rotation shaft:
Diameter

8. Thin disk (mounted vertically)

Position of rotation shaft:
Diameter

9. When a load is mounted on the end of the lever

10. Gear transmission

1. Find the moment of inertia I_B for the rotation of shaft (B).
2. Then, replace the moment of inertia I_B around the shaft (A) by I_A ,

$$I_A = \left(\frac{a}{b}\right)^2 \cdot I_B$$

Load Type

Load type		
Static load: T_s	Resistance load: T_f	Inertial load: T_a
Only pressing force is necessary. (e.g. for clamping)	Gravity or friction force is applied to rotating direction.	Rotate the load with inertia.

⚠ Caution

[CE/UKCA-compliant products]

EMC compliance was tested by combining the electric actuator LER series and the controller JXC series.

The EMC depends on the configuration of the customer's control panel and the relationship with other electrical equipment and wiring. Therefore, compliance with the EMC directive cannot be certified for SMC components incorporated into the customer's equipment under actual operating conditions. As a result, it is necessary for the customer to verify compliance with the EMC directive for the machinery and equipment as a whole.

[Precautions relating to differences in controller versions]

When the JXC series is to be used in combination with the battery-less absolute encoder, use a controller that is version V3.4 or S3.4 or higher. For details, refer to pages 1077 and 1078.

[UL certification]

The JXC series controllers used in combination with electric actuators are UL certified.

The actuator and controller are sold as a package.

Confirm that the combination of the controller and actuator is correct.

<Check the following before use.>

- Check the actuator label for the model number. This number should match that of the controller.
- Check that the Parallel I/O configuration matches (NPN or PNP).

* Refer to the Operation Manual for using the products.

Please download it via our website: <https://www.smcworld.com>

LER Series

Battery-less Absolute (Step Motor 24 VDC)

Specifications

Battery-less Absolute (Step Motor 24 VDC)

Model		LER□50EK	LER□50EJ
Rotation angle [°]		320	
Lead [°]		7.5	12
Max. rotating torque [N·m]		10	6.6
Max. pushing torque 40 to 50% [N·m]*1 *3		4.0 to 5.0	2.6 to 3.3
Max. moment of inertia [kg·m ²]*2 *3		0.13	0.05
Angular speed [°/s]*2 *3		20 to 280	30 to 420
Pushing speed [°/s]		20	30
Max. angular acceleration/deceleration [°/s ²]*2		3000	
Actuator specifications	Backlash [°]	Basic type	±0.2
		High-precision type	±0.1
	Positioning repeatability [°]	Basic type	±0.05
		High-precision type	±0.03
Lost motion [°]*4	Basic type	0.3 or less	
	High-precision type	0.2 or less	
Impact/Vibration resistance [m/s ²]*5		150/30	
Actuation type		Special worm gear + Belt drive	
Max. operating frequency [c.p.m]		60	
Operating temp. range [°C]		5 to 40	
Operating humidity range [%RH]		90 or less (No condensation)	
Enclosure		IP20	
Weight [kg]	Basic type	2.2	
	High-precision type	2.4	
External stopper type	Rotation angle [°]	-2/ arm (1 pc.)	180
		-3/ arm (2 pcs.)	90
	Repeatability at the end [°]/ with external stopper	±0.01	
External stopper setting range [°]		±2	
Weight [kg]	-2/external arm (1 pc.)	Basic type	2.5
		High-precision type	2.7
	-3/external arm (1 pc.)	Basic type	2.6
High-precision type		2.8	
Motor size		□42	
Motor type		Battery-less absolute (Step motor 24 VDC)	
Encoder		Battery-less absolute	
Power supply voltage [V]		24 VDC ±10%	
Power [W]*6		Max. power 57	
Electric specifications			

- *1 Pushing force accuracy is LER50: ±20% (F.S.).
- *2 The angular acceleration, angular deceleration, and angular speed may fluctuate due to variations in the moment of inertia. Refer to the "Moment of Inertia—Angular Acceleration/Deceleration, Effective Torque—Angular Speed" graphs on page 773 for confirmation.
- *3 The speed and force may change depending on the cable length, load, and mounting conditions. Furthermore, if the cable length exceeds 5 m, then it will decrease by up to 10% for each 5 m. (At 15 m: Reduced by up to 20%)
- *4 A reference value for correcting errors in reciprocal operation
- *5 Impact resistance: No malfunction occurred when the actuator was tested with a drop tester in both an axial direction and a perpendicular direction to the lead screw. (The test was performed with the actuator in the initial state.)
Vibration resistance: No malfunction occurred in a test ranging between 45 to 2000 Hz. The test was performed in both an axial direction and a perpendicular direction to the lead screw. (The test was performed with the actuator in the initial state.)
- *6 Indicates the max. power during operation (including the controller)
This value can be used for the selection of the power supply.

Table Rotation Angle Range

- *1 This is the range within which the table can move when it returns to origin. Make sure that workpieces mounted on the table do not interfere with other workpieces or the facilities around the table.
- *2 Position after returning to origin. The position varies depending on whether there is an external stopper.
- *3 [] for when the direction of return to origin has changed

* The figures show the origin position for each actuator.

- *1 Produced upon receipt of order (Robotic cable only)
- *2 The standard cable should only be used on fixed parts.
For use on moving parts, select the robotic cable.
Refer to the [Web Catalog](#) if only the actuator cable is required.
- *3 For details on controllers/drivers and compatible motors, refer to the compatible controllers/drivers on the next page.
- *4 When pulse signals are open collector, order the current limiting resistor (LEC-PA-R-□) on page 1062 separately.
- *5 When "Without controller/driver" is selected for controller/driver types, I/O cable cannot be selected. If an I/O cable is required, refer to the cable for the LECP1 ([Web Catalog](#)) or LECPA ([Web Catalog](#)).

- *6 When "Pulse input type" is selected for controller/driver types, pulse input usable only with differential. Only 1.5 m cables usable with open collector
- *7 The DIN rail is not included. It must be ordered separately.
- *8 Select "Nil" for anything other than DeviceNet®, CC-Link, or parallel input.
Select "Nil," "S," or "T" for DeviceNet® or CC-Link.
Select "Nil," "1," "3," or "5" for parallel input.

⚠ Caution

[CE/UKCA-compliant products]

① EMC compliance was tested by combining the electric actuator LER series and the controller LEC/JXC series.
The EMC depends on the configuration of the customer's control panel and the relationship with other electrical equipment and wiring. Therefore, compliance with the EMC directive cannot be certified for SMC components incorporated into the customer's equipment under actual operating conditions. As a result, it is necessary for the customer to verify compliance with the EMC directive for the machinery and equipment as a whole.

[UL-compliant products (For the LEC series)]

When compliance with UL is required, the electric actuator and controller/driver should be used with a UL1310 Class 2 power supply.

The actuator and controller/driver are sold as a package.

Confirm that the combination of the controller/driver and the actuator is correct.

<Check the following before use.>

- ① Check the actuator label for the model number. This number should match that of the controller/driver.
- ② Check that the Parallel I/O configuration matches (NPN or PNP).

* Refer to the Operation Manual for using the products. Please download it via our website: <https://www.smcworld.com>

	High-precision type	0.55		1.3		2.5		
Motor size		□20		□28		□42		
Motor type		Step motor (Servo/24 VDC)						
Encoder		Incremental						
Proximity sensor (for return to origin)/Input circuit		2-wire						
Proximity sensor (for return to origin)/Input point		1 input						
Power supply voltage [V]		24 VDC ±10%						
Power*6		Max. power 14		Max. power 42		Max. power 57		

- *1 Pushing force accuracy is LER10: ±30% (F.S.), LER30: ±25% (F.S.), LER50: ±20% (F.S.).
- *2 The angular acceleration, angular deceleration and angular speed may fluctuate due to variations in the moment of inertia. Refer to the "Moment of Inertia—Angular Acceleration/Deceleration, Effective Torque—Angular Speed" graphs on pages 776 and 777 for confirmation.
- *3 The speed and force may change depending on the cable length, load and mounting conditions. Furthermore, if the cable length exceeds 5 m, then it will decrease by up to 10% for each 5 m. (At 15 m: Reduced by up to 20%)
- *4 A reference value for correcting errors in reciprocal operation
- *5 Impact resistance: No malfunction occurred when the actuator was tested with a drop tester in both an axial direction and a perpendicular direction to the lead screw. (The test was performed with the actuator in the initial state.)
Vibration resistance: No malfunction occurred in a test ranging between 45 to 2000 Hz. The test was performed in both an axial direction and a perpendicular direction to the lead screw. (The test was performed with the actuator in the initial state.)
- *6 Indicates the max. power during operation (including the controller)
This value can be used for the selection of the power supply.
- *7 The angle displayed on the monitor is automatically reset to 0° every 360°. To set an angle (position), use the "Relative" movement mode. If an angle of 360° or more is set using the "Absolute" movement mode, the correct operation cannot be performed.

Table Rotation Angle Range

- *1 This is the range within which the table can move. Make sure that workpieces mounted on the table do not interfere with other workpieces on the facilities around the table.
- *2 The sensor detection range is recognized as origin. When detecting the sensor, the table rotates in the reverse direction within the sensor detection range.

LER Series

Incremental (Step Motor 24 VDC)

Construction

LER Series Specific Product Precautions 1

Be sure to read this before handling the products. Refer to page 1351 for safety instructions and pages 1352 to 1357 for electric actuator precautions.

Design / Selection

Warning

1. If the operating conditions involve load fluctuations, ascending/descending movements, or changes in the frictional resistance, ensure that safety measures are in place to prevent injury to the operator or damage to the equipment.
Failure to provide such measures could accelerate the operation speed, which may be hazardous to humans, machinery, and other equipment.
2. Power failure may result in a decrease in the pushing force; ensure that safety measures are in place to prevent injury to the operator or damage to the equipment.
When the product is used for clamping, the clamping force could be decreased due to power failure, potentially creating a hazardous situation in which the workpiece is released.

Caution

1. If the operating speed is set too fast and the moment of inertia is too large, the product could be damaged.
Set appropriate product operating conditions in accordance with the model selection procedure.
2. If more precise repeatability of the rotation angle is required, use the product with an external stopper, with repeatability of $\pm 0.01^\circ$ (180° and 90° with adjustment of $\pm 2^\circ$) or by directly stopping the workpiece using an external object utilizing the pushing operation.
3. When using the electric rotary table with an external stopper, or by directly stopping the load externally, be sure to set to [Pushing operation].
Also, ensure that the workpiece is not impacted externally during the positioning operation or in the range of positioning operation.

Mounting

Warning

1. Do not drop or hit the electric rotary table to avoid scratching and denting the mounting surfaces.
Even a slight deformation can cause the deterioration of accuracy and operation failure.
2. When mounting the load, tighten the mounting screws within the specified torque range.
Tightening the screws with a higher torque than recommended may result in a malfunction, while tightening with a lower torque can result in the displacement of the mounting position.

Mounting the workpiece to the electric rotary table

The load should be mounted with the torque specified in the following table by screwing the screw into the mounting female thread. If long screws are used, they can interfere with the body and cause a malfunction.

Model	Screw size	Thread length [mm]	Max. tightening torque [N·m]
LER□10	M4 x 0.7	6	1.4
LER□30	M5 x 0.8	8	3.0
LER□50	M6 x 1	10	5.0

3. When mounting the electric rotary table, tighten the mounting screws within the specified torque range.
Tightening the screws with a higher torque than recommended may result in a malfunction, while tightening with a lower torque can result in the displacement of the mounting position.

Mounting

Warning

Through-hole mounting

Body mounting/Bottom

Body mounting/Top

Model	Screw size	Max. tightening torque [N·m]
LER□10	M5 x 0.8	3.0
LER□30	M6 x 1	5.0
LER□50	M8 x 1.25	12.0

Body tapped mounting

Body mounting/Bottom

Model	Screw size	Max. tightening torque [N·m]	Max. screw-in depth [mm]
LER□10	M6 x 1	5.0	12
LER□30	M8 x 1.25	12.0	16
LER□50	M10 x 1.5	25.0	20

4. The mounting face has holes and slots for positioning. Use them for accurate positioning of the electric rotary table if required.
5. If it is necessary to operate the electric rotary table when it is not energized, use the manual override screws.
When it is necessary to operate the product by the manual override screws, check the position of the manual override screws of the product, and leave necessary space. Do not apply excessive torque to the manual override screws. This may lead to damage and malfunction.
6. The 360° type proximity sensor for return to origin can be changed $\pm 30^\circ$. When changing the position of the proximity sensor for return to origin, tighten the screws with a tightening torque of 0.6 ± 0.1 [N·m].

Model	L [mm] (Initial setting) Cable entry: Basic type/Entry on the left side (Between the sensor holder end face and proximity sensor end face)
LER□10-1	31/31
LER□30-1	42/42
LER□50-1	51.5/51.5

LER Series Specific Product Precautions 2

Be sure to read this before handling the products. Refer to page 1351 for safety instructions and pages 1352 to 1357 for electric actuator precautions.

Handling

Caution

1. When an external guide is used, connect it in such a way that no impact or load is applied to it.

Use a free moving connector (such as a coupling).

2. The moving force should be the initial value (100%).

If the moving force is set below the initial value, there may be variation in the cycle time, or an alarm may be generated.

3. INP output signal

- 1) Positioning operation

When the product comes within the set range of the step data [In position], the INP output signal will turn ON.

Initial value: Set to [0.50] or higher.

- 2) Pushing operation

When the effective force exceeds the [Trigger LV] value (including force during operation), the INP output signal will turn ON.

The [Trigger LV] should be set between 40% and [Pushing force].

- a) To ensure that the clamping and external stop is achieved by [Pushing force], it is recommended that the [Trigger LV] be set to the same value as the [Pushing force].

- b) When the [Trigger LV] and the [Pushing force] are set below the specified range, there is the possibility that the INP output signal will turn ON from the pushing start position.

<Pushing force and trigger LV range>

Model	Pushing force set value [%]	Trigger LV set value [%]
LER□	40 to 50	40 to 50

4. When using the electric rotary table with an external stopper, or by directly stopping the load externally, be sure to set to [Pushing operation].

Also, ensure that the workpiece is not impacted externally during the positioning operation or in the range of positioning operation.

If the product is used in the positioning operation mode, there may be galling or other problems when the product/workpiece comes into contact with the external stopper or external object.

5. When the table is stopped by the pushing operation mode (stopping/clamping), set the product to a position of at least 1° away from the workpiece. (This position is referred to as the pushing start position.)

If the pushing start position (stopping or clamping) is set to the same position as the external stop position, the following alarms may be generated and operation may become unstable.

- a. "Posn failed"

The product cannot reach the pushing start position within the target time.

- b. "Pushing ALM"

The product is pushed back from the pushing start position after starting to push.

- c. "Deviation over flow"

Displacement exceeding the specified value is generated at the pushing start position.

6. There is no backlash effect when the product is stopped externally by pushing operation.

For the return to origin, the origin position is set by the pushing operation.

Handling

Caution

7. For the specification with an external stopper, an angle adjuster bolt is provided as standard.

The rotation angle adjustment range is $\pm 2^\circ$ from the angle rotation end.

If the angle adjustment range is exceeded, the rotation angle may change due to insufficient strength of the external stopper. One revolution of the adjuster bolt is approximately equal to 1° of rotation.

8. In case that gravity is added to the workpiece along the rotation direction when product is mounted vertically, the workpiece may fall down when "SVON" signal is OFF or EMG is not energizing.

9. When mounting the product, secure a bending diameter of 40 mm or longer for the motor cable.

10. The 360° type proximity sensor for return to origin responds when it approaches anything made of metal. For this reason, be sure to keep metal objects other than the proximity dog away from the sensor during return to origin.

Recommended distance: 5 mm or more

Maintenance

Danger

1. The high-precision type bearing is assembled by pressing into position. It is not possible to disassemble it.

LER Series

Battery-less Absolute Encoder Type Specific Product Precautions

Be sure to read this before handling the products. Refer to page 1351 for safety instructions and pages 1352 to 1357 for electric actuator precautions.

Handling

⚠ Caution

1. Absolute encoder ID mismatch error at the first connection

In the following cases, an "ID mismatch error" alarm occurs after the power is turned ON. Perform a return to origin operation after resetting the alarm before use.

- When an electric actuator is connected and the power is turned ON for the first time after purchase*1
- When the actuator or motor is replaced
- When the controller is replaced

*1 If you have purchased an electric actuator and controller with the set part number, the pairing may have already been completed and the alarm may not be generated.

"ID mismatch error"

Operation is enabled by matching the encoder ID on the electric actuator side with the ID registered in the controller. This alarm occurs when the encoder ID is different from the registered contents of the controller. By resetting this alarm, the encoder ID is registered (paired) to the controller again.

When a controller is changed after pairing is completed				
	Encoder ID no. (* Numbers below are examples.)			
Actuator	17623	17623	17623	17623
Controller	17623	17699	17699	17623
ID mismatch error occurred?	No	Yes	Error reset ⇒ No	

2. In environments where strong magnetic fields are present, use may be limited.

A magnetic sensor is used in the encoder. Therefore, if the actuator motor is used in an environment where strong magnetic fields are present, malfunction or failure may occur.

Do not expose the actuator motor to magnetic fields with a magnetic flux density of 1 mT or more.

When installing an electric actuator and an air cylinder with an auto switch (ex. CDQ2 series) or multiple electric actuators side by side, maintain a space of 40 mm or more around the motor. Refer to the construction drawing of the actuator motor.

3. The connector size of the motor cable is different from that of the electric actuator with an incremental encoder.

The motor cable connector of an electric actuator with a battery-less absolute encoder is different from that of an electric actuator with an incremental encoder. As the connector cover dimensions are different, take the dimensions below into consideration during the design process.

Battery-less absolute encoder connector cover dimensions
